Deep Learning Based Medical Image Analysis For Early Disease Detection

Application Screens and Workflow Documentation

Phase III project submission | 30 October 2026

Student / institution: enter the approved cover details. No identity or approval has been invented.

Evidence policy

The screenshots directory contains genuine captures only. The analysis view was exercised with an actual held-out ISIC image, real ResNet-18 inference and Grad-CAM. Additional dashboard, dataset and results captures are included when saved; no mock interface is substituted.

Screenshots

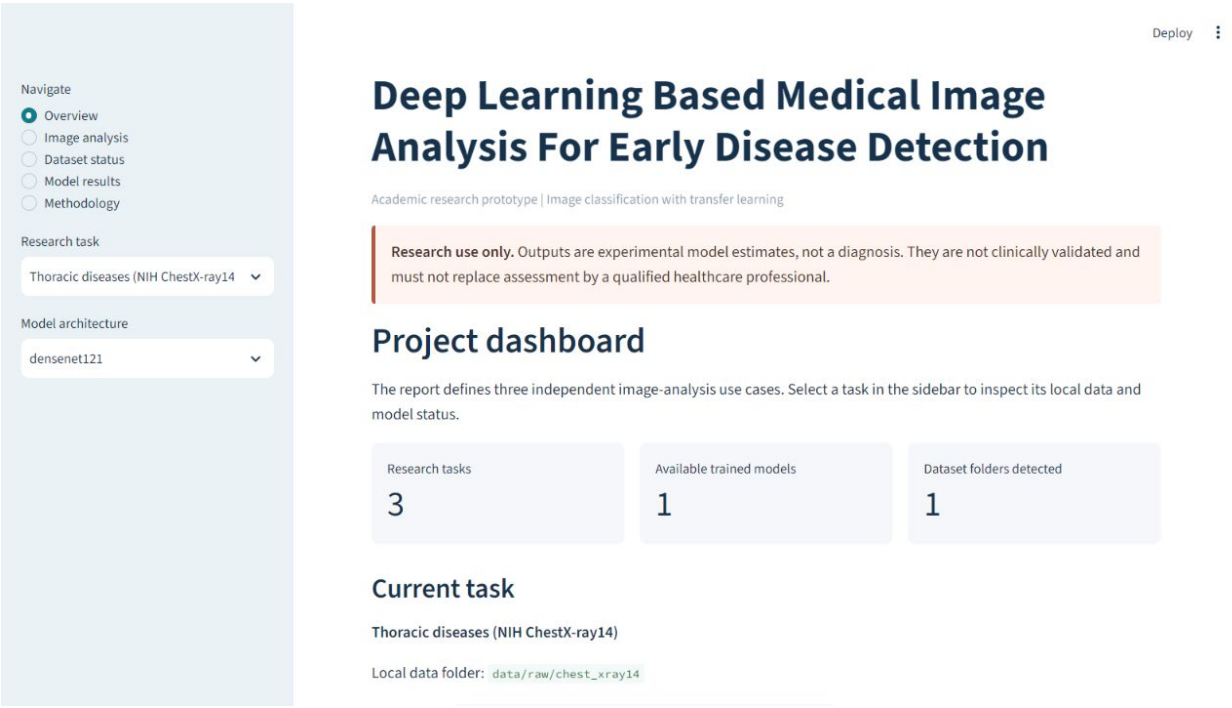

Figure 1. Application overview captured from the working Streamlit app.

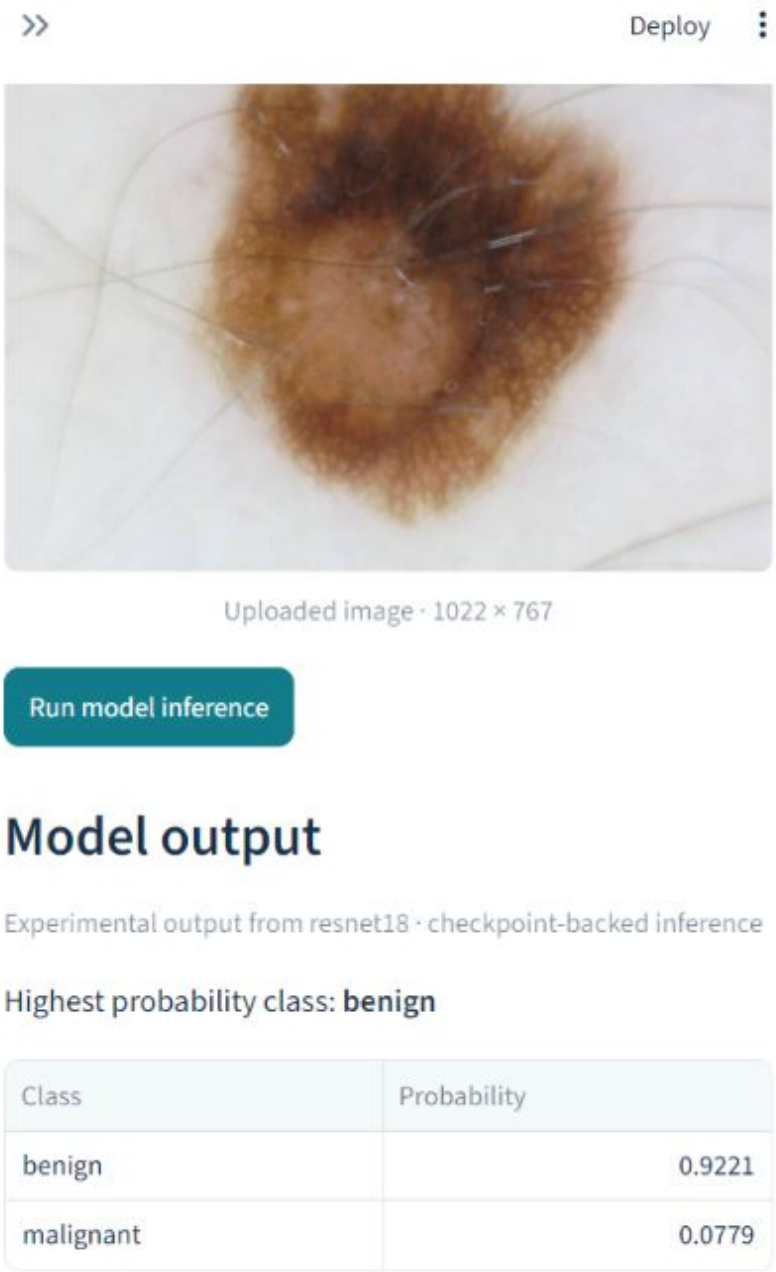

Figure 2. Genuine image upload, checkpoint-backed prediction and class probabilities.

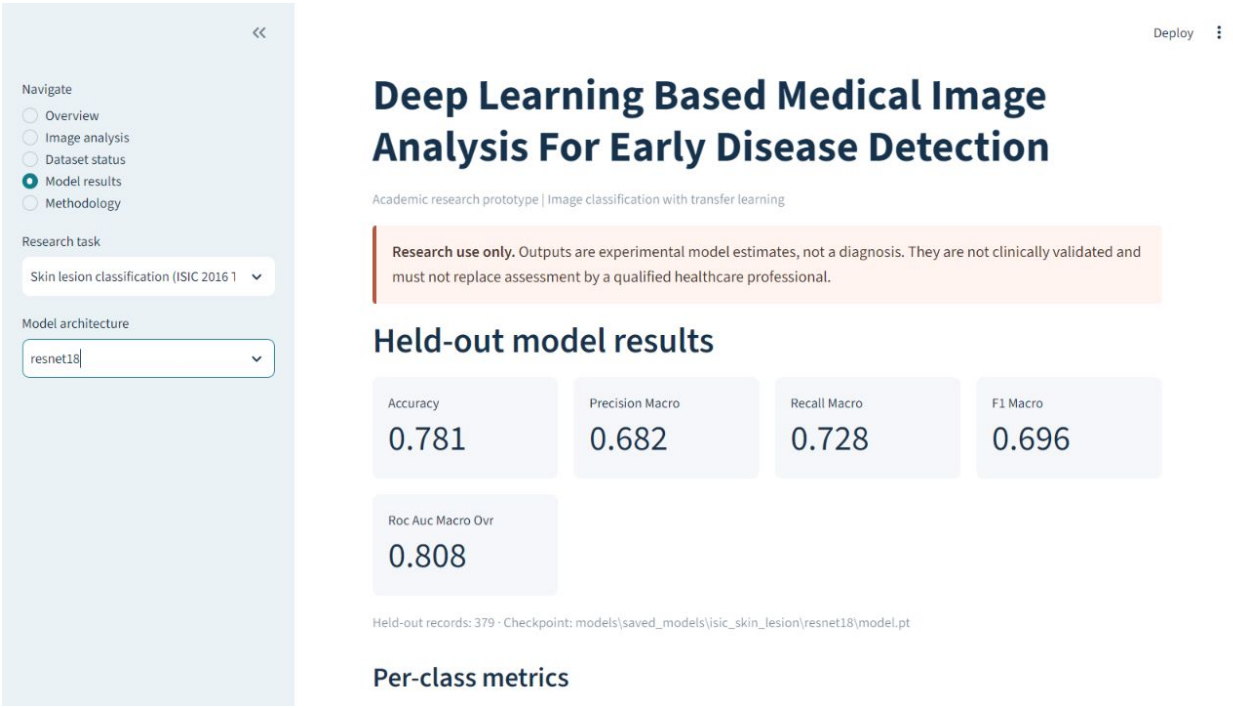

Figure 3. Genuine model results page showing the actual ISIC test evaluation.

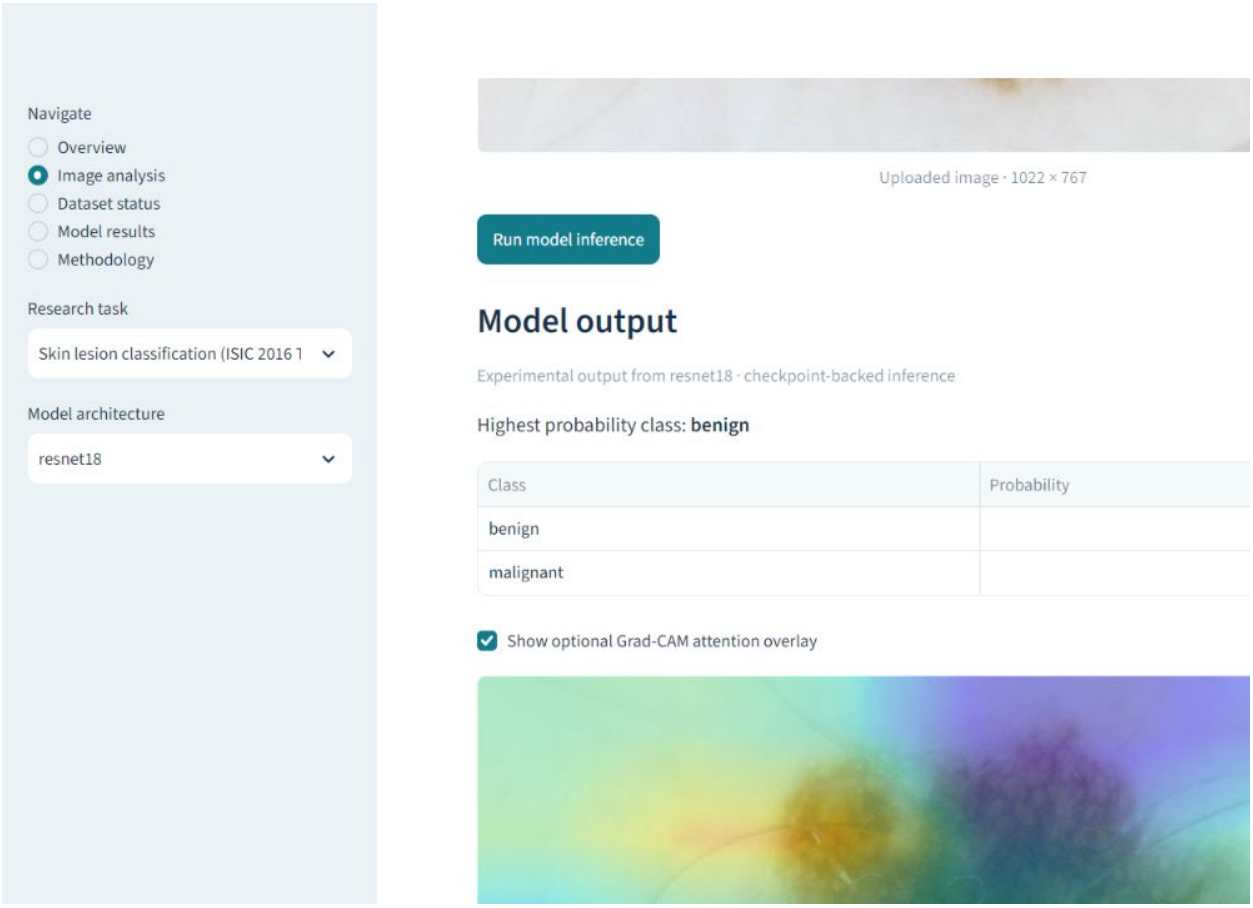

Figure 4. Grad-CAM view from the working app and actual model checkpoint.

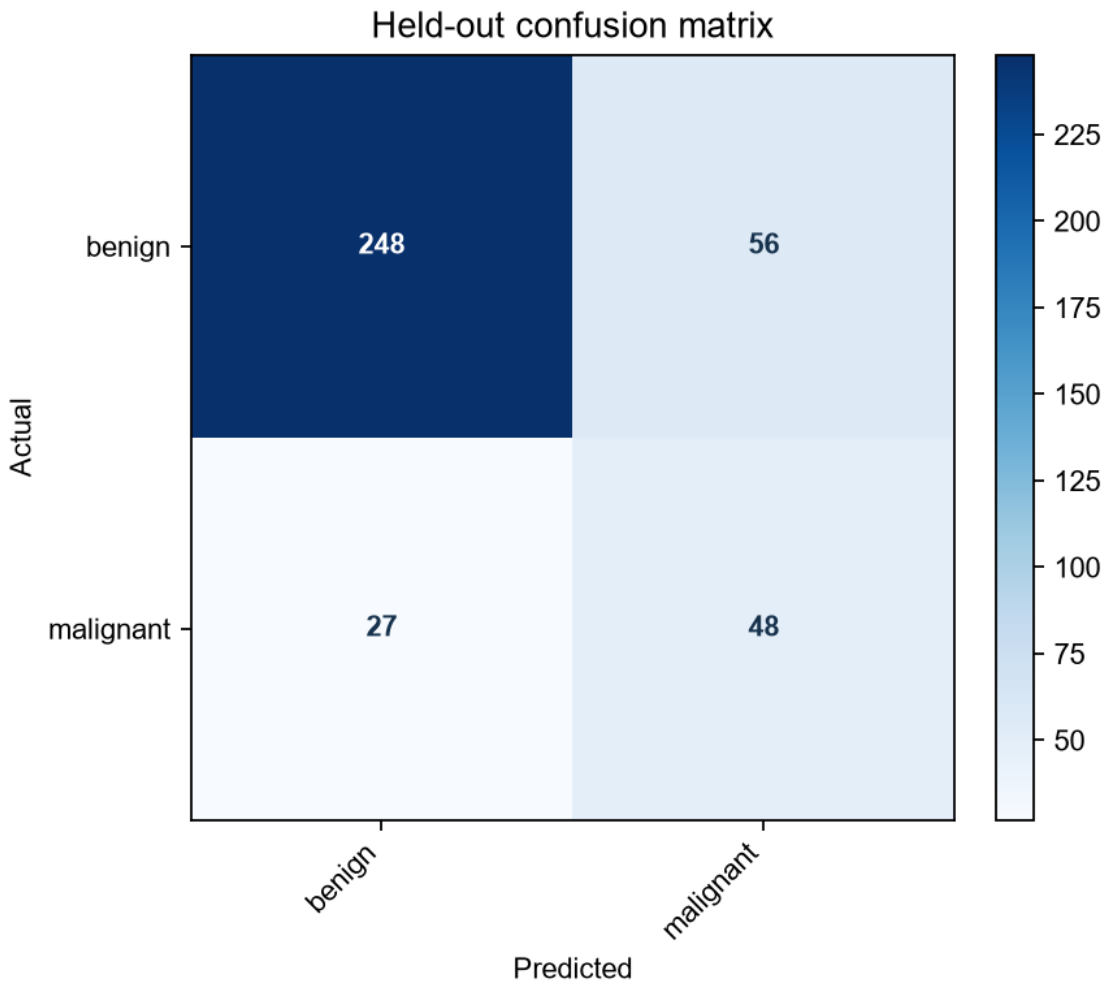

Figure 5. Actual model results visualization; numeric results are also tabulated in Performance Results.

Workflow

Select ISIC skin-lesion task and ResNet-18; upload an allowed image; inspect the preview; run model inference; review class probabilities; optionally enable Grad-CAM. Invalid files are rejected before inference. Outputs are experimental and not diagnostic.

The included screenshots are saved separately in the submission `screenshots/` folders.

Demo recording

No MOV is included unless an actual screen recording is captured. The recording script and checklist are supplied under supporting_materials. A real prototype can be demonstrated locally using the above workflow.
